

MR DIGITAG **MAN**

WE ADD VALUE, SECURITY & INTELLIGENCE

A PROPOSAL FOR FLYSAFAIR

100% SOUTH AFRICAN-OWNED & OPERATED

EVERY BAG. EVERY PASSENGER. EVERY RAND — VISIBLE.

A GPS visibility and intelligence network for FlySafair — protecting checked baggage on ± 180 daily flights across South Africa's busiest airports, opening a self-funding new revenue stream at every check-in and in every ticket sale, and putting Nexus AI to work in every division of the airline.

10.5M

Passengers a year on the FlySafair network —
 $\pm 30,000$ every day

± 180

Daily departures across 11 airports in SA and
the region

R333M

5-year modelled baggage loss, tampering &
never-arrived exposure

R2.07B

5-year combined recovery + new-revenue
opportunity (modelled)

The opportunity, in one page

For an airline moving 10.5 million passengers a year with the world's best on-time record, invisible baggage is the one gap still worth closing.

R333M

5-yr modelled exposure: baggage loss, tampering & bags that never arrive (before any recovery)

Up to R471M/yr

Potential passenger-funded retail revenue at a 15% ticket-flow attach rate

36

Global airlines already live on this exact crowd-find × baggage-tracing integration

No.1

Most on-time airline in the world, 2024 (Cirium) — 95.9% on-time performance

THE CASE, IN THREE SENTENCES

FlySafair already runs the most punctual airline operation on earth and carries roughly six of every ten domestic passengers in South Africa — ±30,000 people and ±17,300 checked bags every single day. But scale changes the math: even at a world-class domestic benchmark of 2.7 mishandled bags per 1,000 passengers, that still means ±78 mishandled bags a day — a modelled R59 million a year in losses, tampering claims and bags that never arrive, R333 million over five years, none of it visible between bag-drop and carousel. Mr Digitag Man's GPS product family closes that gap with technology already live at 36 global airlines, funds itself through vending or ticket-flow sales worth up to R2.65 billion over five years — and Nexus AI turns the same data into working intelligence for every division of the airline.

One airline. One visibility layer. Two ways to fund it — both profitable.

A R112-billion industry problem — even for the best-run airlines

SITA's 2026 Baggage IT Insights Report — the industry's own annual benchmark, published June 2026.

1

5 billion passengers flew in 2025 — and 24 million bags were still mishandled, even after a 23% year-on-year improvement.

2

Every mishandled bag costs the industry an average of R4,600 (\$260) — the current global benchmark.

3

A permanently lost bag costs R11,240 (\$635) — 2.4× a delayed one — because compensation, not operations, drives the cost.

4

Up to 70% of the cost of a lost or damaged bag is compensation paid directly to the passenger.

R112 billion (\$6.3bn). That is what mishandled baggage still costs the global airline industry every year — down 23% on the back of real technology investment, but still real money leaving the industry. The direction of travel is clear: the carriers driving that improvement are the ones already investing in tracking. Standing still means falling behind a curve everyone else is already riding.

South Africa's baggage problem isn't distance — it's hands

FlySafair's point-to-point network is modelled at the world's best benchmark class — what remains is loss, tampering and theft.

Bags mishandled per 1,000 passengers, 2025 (SITA 2026 Baggage IT Insights)

2.7/1,000

the benchmark this model applies to FlySafair — roughly 1 bag in every 370 passengers. World-class — and at FlySafair's scale still ±78 bags going astray every day.

THE PART THE GLOBAL STATS DON'T SHOW

- South African airports have fought a long, public battle with baggage pilferage — ACSA has run repeated anti-theft crackdowns at O.R. Tambo and King Shaka.
- Tampering is a security failure, not a routing failure: a barcode tag shows where a bag was scanned — never what happened to it in between.
- FlySafair compensates valid claims — but no refund recovers the passenger's trust, or takes down the social-media video.

The takeaway: FlySafair is modelled at the best benchmark class in world aviation — and the exposure that remains still compounds to a modelled R59M a year, R333M over five years. The next three slides price it, airport by airport and failure mode by failure mode.

±180 flights a day. Eleven airports. One exposed network.

FlySafair's peak published schedule, modelled airport by airport — every departure is a batch of bags leaving passengers' sight.

65,700

flights a year across the network

±29,600

passengers boarding on a peak day

±17,300

checked bags into the belly every day — ±6.3M a year

Indicative peak-season schedule modelled from FlySafair's published network, August 2026 — frequencies vary by day and season. The annual financial model uses a conservative 10.5M passengers.

Airport	Code	Daily departures	Est. daily boarding pax
O.R. Tambo Int'l, Johannesburg	JNB	62	±10,190
Cape Town International	CPT	48	±7,890
King Shaka Int'l, Durban	DUR	26	±4,280
Lanseria International	HLA	12	±1,970
Chief Dawid Stuurman Int'l, Gqeberha	PLZ	10	±1,640
George	GRJ	8	±1,320
King Phalo, East London	ELS	6	±990
Bram Fischer Int'l, Bloemfontein	BFN	3	±490
Kimberley	KIM	2	±330
Mauritius (regional)	MRU	2	±330
Zanzibar (regional)	ZNZ	1	±160
NETWORK TOTAL		±180	±29,600

Three ways value leaks — every single day

Modelled at SITA's domestic benchmark and South African pilferage patterns, FlySafair's scale turns “rare” into “daily”.

None of this is visible today. A barcode tag records scans, not journeys. From the moment a bag disappears behind the bag-drop until it lands on a carousel, it is dark — to the passenger, to the airline, and to security. Dark is where all three failure modes live.

What the dark window costs FlySafair

A transparent, source-cited model — SITA 2026 benchmarks at R17.70/\$, calibrated to a domestic point-to-point operation.

R161,700
modelled cost walking out the door every day

R4.92M
every month

R59.0M
every year — before any recovery layer

THE ANNUAL BUILD-UP

Cost stream	Volume/yr	Cost/yr
Delayed & damaged bags × R1,150	27,216	R31.3M
Bags that never arrive × R11,240	1,134	R12.7M
Tampering & pilferage claims × R2,850	5,250	R15.0M
TOTAL MODELLED ANNUAL EXPOSURE	33,600	R59.0M

Excludes brand and reputational cost entirely: a single viral tampering video can cost more than a year of claims. Shown separately in this proposal — never blended into the total.

THE HORIZON

Monthly

R4.92M

Year 1

R59.0M

3 years

R187.9M

5 years

R332.6M

Growth at 6% p.a. compounding — slower than FlySafair's own recent capacity growth.

Every rand above is an operating cost FlySafair already carries today. The two commercial routes in Section 04 make the recovery layer self-funding — the passenger pays for the visibility, and the airline keeps the savings and the margin.

FlySafair

The most on-time airline on earth, and the backbone of South African domestic travel — protecting that record is the whole point.

95.9%
on-time performance — the world's most punctual airline, 2024 (Cirium)

±60%
share of South Africa's domestic market — six in ten local passengers

35
Boeing 737-800s — one fleet type, ±180 departures a day, 11 airports

50M+
passengers carried since the first flight in October 2014

THE MODELLED EXPOSURE, TODAY	
Mishandled bags / year (modelled)	28,350
Tampering & pilferage claims / year	5,250
Of which never arrive / year	1,134
Modelled annual cost	R59.0M
Conservative recovery (40%)	R23.6M / yr
Moderate recovery (65%)	R38.4M / yr
Aggressive / SITA-proven (90%)	R53.1M / yr

A No.1 on-time record proves FlySafair runs the tightest operation in the sky. The Digitag layer extends that same discipline to the one journey the operation can't see today — the bag's.

Introducing Mr Digitag Man

A Johannesburg-based technology integrator — two South African champions, one passenger promise.

WHO WE ARE

Mr Digitag Man (Pty) Ltd is a full-stack technology integrator headquartered in Johannesburg, built on 17+ years of South African market experience across the exact disciplines this proposal draws on:

- ✓ GPS & fleet tracking — the discipline behind this entire proposal
- ✓ Security, CCTV & access control — for airport-precinct hardening
- ✓ AV & digital signage — for passenger-facing vending and wayfinding
- ✓ IT infrastructure & software development — for the reporting layer your teams would actually use
- ✓ In-house engineering: product, firmware and support are not outsourced offshore

From the vending station firmware to the Nexus AI dashboard: designed, built and supported from Johannesburg.

WHY THIS FITS FLYSAFAIR

- Proven global technology, not a pilot: the same crowd-find infrastructure already live at 36 major airlines, brought to South Africa's biggest domestic carrier first.
- Two SA champions: South Africa's airline and a 100% South African-owned tracking company — same time zone, same rand, no import-agent chain.
- A full-ecosystem integrator, not a single-product vendor — GPS visibility sits alongside CCTV, access control, signage and IT under one accountable partner.
- One commercial counterparty, direct engineering accountability — and a partner that can grow into sales offices, cargo and airport ops from the same platform.

17+

years in the South African market

36

airlines live on the underlying technology

1

accountable partner, end to end

Proven technology — not an experiment

Every Mr Digitag Man GPS product in this proposal runs on infrastructure already validated at global scale.

90%

cut in permanently-lost luggage in year one — consumer crowd-find networks integrated with airline baggage-tracing systems

36

airlines worldwide already accepting crowd-find / share-item-location for baggage recovery

26%

faster delayed-bag recovery on the same technology

2.7/1,000

the domestic point-to-point benchmark FlySafair is modelled at — the world's best-run corridor class

The gap this proposal closes: British Airways, Lufthansa, Qantas, Cathay Pacific, Virgin Atlantic and 31 more airlines already use this exact ecosystem in their own operations. No African carrier has deployed it as owner-operated, passenger-facing infrastructure at network scale — FlySafair can be first, on home soil, with a South African partner.

HOW EACH PRODUCT USES IT

D-Sticker

Global crowd-find network — hourly updates, no SIM

D-Card

Global Bluetooth crowd-source network + 75dB buzzer

D-Pod

Global crowd-find network — multi-year covert asset layer

Nexas AI

ClearVision AI's 77-agent command center reads all three — Section 06

D-Sticker

“Silent. Disposable. Traceable.” — one sticker outlives the whole journey, and the entire tracing window after it.

R500

retail per unit — the price already shown on the vending renders

8–12 wks

active life — outlasts the trip and the claim window

Hourly

location updates via the global crowd-find network

4g

ultra-thin: 0.4–1.2mm, invisible on any bag

WHY IT FITS A LOW-COST CHECK-IN HALL

- ✓ Zero installation — peel-and-stick onto any bag, working within the hour
- ✓ Waterproof, eco-friendly thermal-paper construction; no bulk, no wiring
- ✓ Powered by the global crowd-find network — no SIM, no monthly subscription
- ✓ Every trip starts at 100% battery — the natural upsell at check-in and at booking
- ✓ Silent by design: no alerts pushed to nearby strangers' devices

THE NETWORK OPPORTUNITY

210,000 – 1.57M

units a year across the two sales options — 2% walk-up vending to 15% ticket-flow attach

R105M – R471M

in passenger-funded revenue a year — this product pays for its own rollout

Sold two ways — smart vending at every airport and check-in, or one tap in the FlySafair booking flow — see Section 04, The Two Commercial Routes.

D-Card

“Loss is silent. So is control.” — a credit-card-format tracker for the wallet, laptop bag or carry-on of the JNB–CPT commuter.

R1,650

retail per unit, premium travel segment

24 mo

battery life — no recharging, no mid-year re-purchase

15–20m

Bluetooth range + global crowd-source network

IP65

rated, aerospace-grade aluminium

BUILT FOR THE FREQUENT-FLYER CORE

- ✓ Lives permanently in the wallet or laptop bag of South Africa's business commuters
- ✓ 75dB buzzer for close-range recovery; global Bluetooth crowd network for long-range
- ✓ CUT-ready and linked to national stolen-asset recovery channels
- ✓ Positions FlySafair's premium bundles as security-forward — not just legroom

THE NETWORK OPPORTUNITY

5,250

units a year — 0.05% of passengers: the Johannesburg–Cape Town commuter core, one of the world's busiest domestic corridors

R8.7M

potential retail revenue a year, sold via web shop, kiosk and on-board retail

Weighted to the JNB–CPT “golden route” and sold through kiosk, web-shop and on-board channels rather than mass vending.

D-Pod (“The Dome”)

“Visibility doesn't ask permission.” — a magnetic, covert tracker for company assets and high-value freight. Placed in seconds, invisible for years.

R2,150

per unit — one-time capex for years of visibility

3–5 yrs

battery life on a single charge cycle

8–25/day

location updates; first position within ± 1 hour

IP68

waterproof, magnetic base — no tools, no wiring

BUILT FOR FLYSAFAIR'S OWN ASSETS

- ✓ Magnetic base — installed in seconds on a spares crate, cage, cart or container
- ✓ AOG spares and rotatables tracked between JNB, CPT and DUR — a grounded 737's real cost is time
- ✓ Fully covert — no visible wiring, no notification to anyone nearby
- ✓ Extends the same visibility principle to high-value belly freight and valuables pouches

THE NETWORK OPPORTUNITY

850 units

indicative — spares crates, baggage carts, GSE and valuables pouches across the three main bases

≈ R1.83M

indicative one-time capex for the life of the device (3–5 years)

Because it lasts years, not weeks, D-Pod needs a fraction of the unit count of a consumer product — durability is the economics. Unit counts confirmed with FlySafair's ops and engineering teams at technical scoping.

Three products, one continuous layer of visibility

Each product is matched to where value actually leaks — not sold as a one-size-fits-all tag.

1

PASSENGER CHECK-IN & TICKET SALE

D-Sticker

Peel-and-stick onto checked luggage — bought at the vending kiosk or added to the ticket at booking. Passenger-funded, single-trip.

2

PERSONAL CARRY-ON & COMMUTE

D-Card

Lives permanently in the wallet, laptop bag or premium carry-on of the frequent flyer on the JNB—CPT corridor.

3

SPARES, FREIGHT & COMPANY ASSETS

D-Pod

Magnetic, covert, multi-year — protecting AOG spares, high-value freight, carts and ground equipment.

One app, one dashboard, one control-room view: every device across all three products reports into the same Mr Digitag Man platform — live map location, geo-zones, offline alerts and exportable reporting — and the same feed powers Nexus AI, so FlySafair's operations, security and commercial teams all see one picture, not three.

Where Mr Digitag fills the gaps

Failure mode by failure mode: the gap FlySafair lives with today, the product that closes it, and what Nexas AI adds on top.

The failure mode	The gap today	The Digitag answer	What Nexas AI adds
Lost & delayed ±78 bags/day	Barcode scans stop at the belt. Passengers queue at a desk to ask a question nobody can answer: “where is my bag?”	D-Sticker — live hourly position shared straight into baggage tracing; 26% faster recovery, proven at 36 airlines.	NEXA answers “where is my bag?” from the live Digitag feed; Amber runs each recovery as a tracked mission.
Tampered & pilfered ±14 claims/day	No evidence of where a bag was opened — claims default to payout, and the thief’s window stays invisible.	D-Sticker + D-Pod — a timestamped location trail turns “somewhere between JNB and CPT” into “this zone, this shift”.	Sentinel-X anomaly triage flags pattern breaks; Document Studio builds evidence-grade packs for ACSA, insurers, SAPS.
Never arrives ±3 bags/day	R11,240 per bag in compensation — and a passenger, and their story, lost for life.	D-Sticker keeps reporting for 8–12 weeks — covering the entire tracing window, long after the flight has landed.	Claims triaged, correspondence drafted by legal and support agents, every case tracked in Mission Control.
Invisible company assets	Spares, carts and GSE go dark between stations — found by phoning around, not by looking at a screen.	D-Pod — covert, magnetic, multi-year visibility on every high-value asset FlySafair owns or moves.	Analytics dashboards on every tagged asset: what moved, what sat idle, what left a geofence it never should have.

Every cell above is covered by the two commercial options that follow — no separate security budget required.

Option 1 — Smart vending at every airport & check-in

Self-service GPS vending stations at all FlySafair airports — beside check-in counters, ticket-sales outlets and departures concourses.

HOW IT WORKS

- ✓ ±40 smart vending stations across the 11-airport network — sized to each airport's daily departures
- ✓ Passenger pays R500 at the kiosk; sticker is on the bag in under a minute, live in the app before boarding
- ✓ Sells to every traveller in the terminal — not only FlySafair passengers: pure upside walk-up trade
- ✓ Zero staffing — stations stocked and serviced by Mr Digitag Man under SLA
- ✓ FlySafair earns margin on every unit sold at its check-in zones; station capex carried by the programme

THE REVENUE, MODELLED

Opt-in	Units/yr	Per day	Month	Year 1	5 yrs
Conservative 2%	210,000	R287,700	R8.75M	R105M	R592M
Moderate 5%	525,000	R719,200	R21.9M	R262.5M	R1.48B
Aggressive 8%	840,000	R1.15M	R35.0M	R420M	R2.37B

R719,200 a day at a moderate 5% opt-in	R262.5M a year at 5% — R835.7M over 3 years	R2.37B 5-year gross at the aggressive 8% case
--	---	---

Fastest to revenue: no booking-system integration, first stations live ±90 days from signature. Figures are gross passenger spend incl. VAT at R500/unit; 3-year figures: R334M (2%) · R836M (5%) · R1.34B (8%). Commercial split and volume tiers confirmed at commercial stage.

Where it goes: check-in, outlets & departures

Deployment-concept renders — self-service GPS vending placed exactly where FlySafair passengers already pause.

Beside FlySafair check-in counters — the natural upsell moment before bags disappear from view

Self-service kiosk zone — card/tap payment, sticker applied in under a minute

Departures concourse tower — “Track Your Luggage Worldwide”, high-footfall placement

Recommended placement: within 15–20m of check-in counters, ticket-sales outlets and self-service kiosks — visible before a passenger commits to letting a bag out of sight.

One platform, six physical formats

Deployment-concept renders — final unit design, FlySafair co-branding and footprint confirmed with each airport's terminal team.

Standard-format GPS Smart Station — the network workhorse

Map-display variant — live tracking preview at point of sale

Co-branded format — ready for a FlySafair-branded rollout

Curved-panel flagship — premium terminal placements

Modular twin-panel wall unit — R500 pricing on display

Slim wall-mount — corridor and washroom-adjacent placements

Option 2 — One tap in the FlySafair booking flow

FlySafair wrote South Africa's ancillary-revenue playbook — seats, bags and flexibility are already add-ons. “Digitag Protect” becomes the next toggle.

- 1

Passenger adds “Digitag Protect — R299” at booking

One toggle in the payment path, next to seat selection and checked bags — exactly where FlySafair already converts best.
- 2

Sticker applied at bag-drop in seconds

Pre-paired to the booking reference at the counter or kiosk — no queue added, no new staff process beyond peel-and-stick.
- 3

The bag is live before the aircraft doors close

Passenger tracks it in the app; Nexas AI watches every tagged bag on the rotation. Margin stays with FlySafair — no vending capex at all.

THE REVENUE, MODELLED

Attach	Units/yr	Per day	Month	Year 1	5 yrs
Conservative 6%	630,000	R516,100	R15.7M	R188.4M	R1.06B
Moderate 10%	1.05M	R860,100	R26.2M	R313.9M	R1.77B
Aggressive 15%	1.58M	R1.29M	R39.2M	R470.9M	R2.65B

R860,100

a day at a moderate 10% attach

R313.9M

a year at 10% — R999.5M over 3 years

R2.65B

5-year gross at the aggressive 15% case

Why R299 beats R500 here: conversion in the payment path beats conversion in the concourse — the in-flow price is set deliberately below the kiosk price to drive attach. 3-year figures: R600M (6%) · R999M (10%) · R1.50B (15%). At an illustrative 45% margin, the moderate case adds ±R141M a year to FlySafair's ancillary line.

Two options, one decision — and they compound

Both routes sell the same R500-value product through FlySafair's own front doors — they differ in speed, reach and economics.

OPTION 1		OPTION 2	
Smart vending network		Ticket-flow integration	
Year-1 gross (2% → 8%)	R105M – R420M	Year-1 gross (6% → 15%)	R188M – R471M
5-year gross (aggressive)	R2.37B	5-year gross (aggressive)	R2.65B
Time to first revenue	±90 days	FlySafair margin (moderate, 45%)	±R141M / yr
✓ Zero IT integration — no booking-system work at all ✓ Sells to the whole terminal, including non-FlySafair passengers ✓ Physical brand presence at every check-in and outlet		✓ Attach-rate economics — sold where FlySafair already converts ✓ Zero floor space, zero station capex, zero staffing ✓ Every unit pre-paired to a booking — cleaner data for Nexus AI	

The recommended path is both: launch Option 1 in ±90 days while the Option 2 integration is built, then run them together — vending keeps serving walk-ups and other carriers' passengers after the ticket flow goes live. Modelled together at R390M+ a year, without double-counting.

How every number in this proposal was built

A transparent, source-cited model — deliberately conservative-defensible, not sales-inflated.

- 1

Passengers

10.5 million a year — modelled from FlySafair's published ±30,000 passengers/day and ±180 daily flights; ±60% domestic share.
- 2

Mishandling rate

2.7 bags per 1,000 passengers — SITA's domestic / point-to-point benchmark class, not the higher global or transfer-heavy rates.
- 3

Never-arrived share

4% of mishandled bags are never recovered (SITA 2026) — the highest-cost, highest-emotion failure mode.
- 4

Tampering layer

0.5 claims per 1,000 passengers — modelled on South Africa's documented airport-pilferage history; FlySafair publishes no official rate.
- 5

Unit costs

R1,150 per delayed/damaged bag (domestic-calibrated), R11,240 per never-arrived bag and R2,850 per tampering claim — SITA 2026 benchmarks at R17.70/\$.

THREE RECOVERY SCENARIOS

40%

Conservative

A cautious first-year adoption-and-recovery assumption, before any process maturity.

65%

Moderate

Mid-point recovery once vending and ticket-flow sales are embedded and habits form.

90%

Aggressive

The SITA-documented real-world result: crowd-find × airline tracing cut permanently-lost bags 90% in year one.

Growth: 6% p.a. compounding — below FlySafair's own recent trajectory. Scope: the exposure model covers checked baggage and tampering only; revenue is modelled separately and never blended into the savings total.

The recovery case: turning R59M a year of leaks into savings

Applying the three scenarios to FlySafair's modelled exposure — checked-baggage and tampering layer only.

R53.1M

Modelled Year-1 savings (aggressive / SITA-proven scenario)

R169.1M

3-year cumulative savings (aggressive, 6% p.a. growth)

R299.4M

5-year cumulative savings (aggressive, 6% p.a. growth)

Scenario	Year 1	3-Year Cumulative	5-Year Cumulative
Conservative (40%)	R23.6M	R75.1M	R133.1M
Moderate (65%)	R38.4M	R122.1M	R216.2M
Aggressive (90%, SITA-proven)	R53.1M	R169.1M	R299.4M

WHAT 90% MEANS,
PHYSICALLY

±70 of the 78 bags that would go astray each day, found before the carousel empties — and tampering windows closed before claims are filed.

THE RECORD THIS PROTECTS — FlySafair closed 2024 as the most on-time airline in the world (Cirium, 95.9%) and carries six in ten of South Africa's domestic passengers. A GPS visibility layer doesn't fix a weakness here; it extends a record-breaking operation into the one journey it cannot yet see — and keeps the country's most trusted airline ahead of anyone trying to copy it.

The combined FlySafair number

Losses recovered plus the new revenue stream, one picture — before D-Card, D-Pod or a cent of reputational upside is added.

5-YEAR COMBINED OPPORTUNITY

R2.07B

cumulative modelled value: recovered losses (aggressive / SITA-proven scenario) + Digitag Protect ticket-flow revenue at a moderate 10% attach.

Layer	Year 1	3-Yr	5-Yr
Losses recovered (90%)	R53.1M	R169.1M	R299.4M
Digitag Protect revenue (10%)	R313.9M	R999.5M	R1.77B
Combined	R367.1M	R1.17B	R2.07B

Deliberately not included: D-Card retail (R8.7M/yr), D-Pod asset savings, insurance-terms upside and vending sales to non-FlySafair passengers — headroom above this number, never padding inside it.

Introducing Nexas AI

“One login. Seventy-seven minds. Zero pretence.” — the AI-agent business command center by ClearVision AI, put to work on FlySafair's own data.

77 agents

named specialist AI agents across 16 divisions — a full virtual staff complement

NEXA

the head butler and command core — one login, one interface, every domain

13 modules

War Room, Mission Control, CRM, Document Studio, Quotes, Analytics and more

Proudly SA

POPIA, SARS, CCMA and OHS fluent — priced in rand, planned around load-shedding

HOW FLYSAFAIR WOULD USE IT

- ✓ Ask NEXA anything — “what did baggage cost us in July?” — and get the answer with the evidence attached, straight off the Digitag feed
- ✓ Brief Amber, the chief orchestrator, once — she turns it into a mission with owners, steps and a finish line across the right agents
- ✓ Watch live operations in the War Room; track agents, missions and performance from the command dashboard
- ✓ Memory learns FlySafair's context between sessions; Plugins connect the Digitag device feed, DCS and booking flow

WHAT IT CHANGES

77 → 1 login

a full staff complement of specialist expertise behind a single secure command center

1 brief → 1 mission

multi-agent work planned, routed, tracked and synthesised into one answer

R0 extra headcount

every division gains capability without a single new salary line

Nexas AI is a ClearVision AI platform. Licences ride on the commercial programme — included in both Option 1 and Option 2, not a separate IT line item.

One AI workforce, every division of FlySafair

77 named specialist agents across 16 divisions — below, the crew each FlySafair division puts to work from day one.

Ground Ops & Baggage Rita (operations analyst), Stella (QA) and Ronan (warehouse) map processes, find bottlenecks and write the SOPs — with live Digitag positions as the evidence.	Customer Care Wendy fronts every enquiry, Ryan designs support systems that turn complaints into loyalty, Melissa drives retention — “where is my bag?” answered before anyone phones.	Commercial & Revenue Charles, Samantha and Hannah build the Digitag Protect pipeline; Evan, Rachel and Eleanor run full-funnel marketing, SEO and PR for the launch.	Flight Ops & Projects Tyler runs each rollout phase on scope, schedule and budget; Erica coordinates across teams; Paula schedules around time zones and load-shedding.
Safety, Security & Fraud Sentinel-X monitors anomalies and triages alerts; Simon hardens the platform; Frank spots fraud before money moves; Marlene keeps OHS Act compliance tight.	Engineering & Maintenance Christopher coordinates crews and work orders; Tanya root-causes failures; Marius diagnoses vehicles; Natalie keeps infrastructure alive through load-shedding.	Finance, Legal & Tax Liza owns cash flow and forecasting; Colin gets invoices paid; Sipho keeps it SARS-compliant; Cornelius and Peter handle contracts and labour law; POPIA built in.	HR, Training & Executive Karen runs people strategy; Cory builds training via Classroom; Vincent and Oscar give the board strategy and evidence-first research — with sources attached.

Nobody needs to remember who does what: ask NEXA, and the head butler routes the work to the right specialist — or brief Amber and she runs it as a multi-agent mission.

Nexas AI — capabilities and what they're worth

Built to be used by people who run an airline, not by data scientists — in plain language, priced in rand.

CAPABILITIES

- ✓ NEXA command core — business Q&A across every domain, with memory and context that persists between sessions
- ✓ Multi-agent missions — brief Amber once; she plans, routes, tracks and synthesises the result
- ✓ War Room and command dashboard — live view of active agents, missions and operations
- ✓ Document Studio and Quotes — claims packs, SOPs, reports and proposals generated where the agents work
- ✓ Built-in CRM and analytics — the Digitag Protect ancillary line measured live, against this very model
- ✓ Classroom — AI-powered training modules for ground staff, contact centre and sales teams
- ✓ Plugins — connect the Digitag device feed, DCS, booking flow and existing tools
- ✓ South African to the core — POPIA, SARS, CCMA, OHS Act and load-shedding-aware, with secure per-business sign-in

THE BENEFITS, MEASURED

Headcount leverage	a full staff complement of expertise without the payroll — 77 specialists on day one
Contact-centre load	“where is my bag?” answered from the live feed before the call is dialled
Claims cost	fewer claims, resolved faster, each one an evidence-based Document Studio pack
Ancillary revenue	attach rates, opt-ins and revenue tracked live against this deck's model
Board visibility	one live number for baggage — exposure, recovery, revenue — with sources attached

Live from Phase 1: the O.R. Tambo pilot ships with a working Nexas AI dashboard from day one — trained on FlySafair's own tracker data, not a demo dataset.

A 12-month rollout, de-risked by design

Prove it at the highest-exposure airport first — then scale with evidence, not assumptions.

Every phase is independently reversible — FlySafair validates commercial and operational assumptions with real data before committing to the next. By month 12 the network is fully live, and every figure in this deck has been tested against reality.

This isn't a technology decision. It's a five-year bet on who owns passenger trust in South African skies.

IF NOTHING CHANGES

Five years of standing still

- ✗ R333M in losses, tampering and never-arrived bags keeps walking out the door, quietly
- ✗ ±78 bags a day still go dark the moment they leave the passenger's hands
- ✗ The next viral tampering video is a matter of when — and it lands on the market leader
- ✗ R1.77B of modelled 5-year ancillary revenue is left unbuilt
- ✗ Another carrier claims “the airline where bags don't disappear” first
- ✗ Claims keep being processed by hand — and the board only sees the cost at year-end

IF FLYSAFAIR ACTS NOW

Five years of leading the market

- ✓ Up to R299M recovered — the 90% cut in never-arrived bags is SITA-proven, not projected
- ✓ R1.77B+ of new passenger-funded revenue built at a moderate 10% attach
- ✓ Every checked bag visible from bag-drop to carousel — and every claim answered with evidence
- ✓ The world's most on-time airline becomes the world's most transparent on baggage
- ✓ Nexus AI working in every division, on data no competitor has
- ✓ A 12-month, phase-gated rollout — reversible at every step, evidence before commitment

So the only real question left: *does FlySafair spend the next five years paying for invisible bags — or being the airline that made them visible?*

READY WHEN YOU ARE

Why Mr Digitag Man, and what happens next

- ✓ 17+ years of South African market experience — a local partner for a local champion, in the same time zone and the same rand
- ✓ A full-ecosystem integrator, not a single-product vendor — GPS visibility alongside CCTV, access control, signage and IT under one accountable partner
- ✓ Proven global technology — the crowd-find × airline-tracing ecosystem live at 36 airlines — brought to Africa's leading low-cost carrier first
- ✓ Direct engineering accountability, product ownership and a single commercial counterparty — no offshore escalation chain
- ✓ Nexas AI included — ClearVision AI's 77-agent command center rides on the commercial programme, not on FlySafair's IT budget

PROPOSED NEXT STEP

A 45-minute working session with FlySafair's commercial, ground-operations and IT teams to scope the O.R. Tambo pilot — timeline, commercial structure, success metrics and the Digitag Protect booking-flow test.

THE OPPORTUNITY ON THE TABLE

R2.07B over five years

Recovered losses plus passenger-funded revenue — for a programme that funds itself from the first sticker sold.
